Flow-2 Hands-On Guideline

Marketplace Tasks — Hands-on Practice

Pick 1 of 5 Options | **Strict token limit per learner** | **PowerPoint report deck** | **80+ to pass**

Important: Use only public or sample data when working with AI tools.

Do not upload, share, or disclose internal information, source code, documents, or customer data.

Direct the AI. Prove your judgement. Evidence everything.

IMPORTANT — ISM COMPLIANCE

VDI Security & Compliance Rules

Mandatory rules every learner must follow when using the VDI environment for Flow-2 hands-on practice.

1. Only use the VDI environment for AI learning and hands-on practice purposes.
2. Do not process customer data, internal data, or confidential information in the training environment.
3. Do not upload any documents containing FPT or customer information to AI tools.
4. Do not use the training account/environment for daily work (email, Teams, project communication, etc.).
5. Report any violation or incident immediately to IT/ISM via ISMS@fpt.com / ITC@fpt.com.

START HERE

Hands-on Steps

1

Download the template

Copy the report deck PPTX template as your working file

(Ex: Flow2_[Account]_Flezi-A_Option_[Number of option]

2

Select 1 of 5 Options

Read & Understand exactly what the requirement is asking for

3

Run the task with agents

Do the work with AI agents, step by step

4

Capture evidence

Screenshot every real result as proof

5

Add evidence to the deck

Place each screenshot on its matching slide

6

Submit the PPTX

Upload the finished report deck to the PowerApps form

Every step leaves an artifact — the screenshots are the evidence trail inside the submitted PPTX.

START HERE

The whole assessment on one slide

Tool

ChatGPT Enterprise + Codex by default. Use your FSU/BU/Client license (Claude / GitHub Copilot /...) if one is provided to you

Task

Pick 1 of 5 Options. Extra options earn bonus — only if credits remain.

Budget

250 credits / 1 weeks. Default GPT Luna, step up to GPT Terra. GPT Sol+ is out of scope.

Modes

Chat to think. Work to produce a deliverable. Codex to change a codebase.

MCP if you have

Selecting the right server and saying why is required. Using it is bonus.

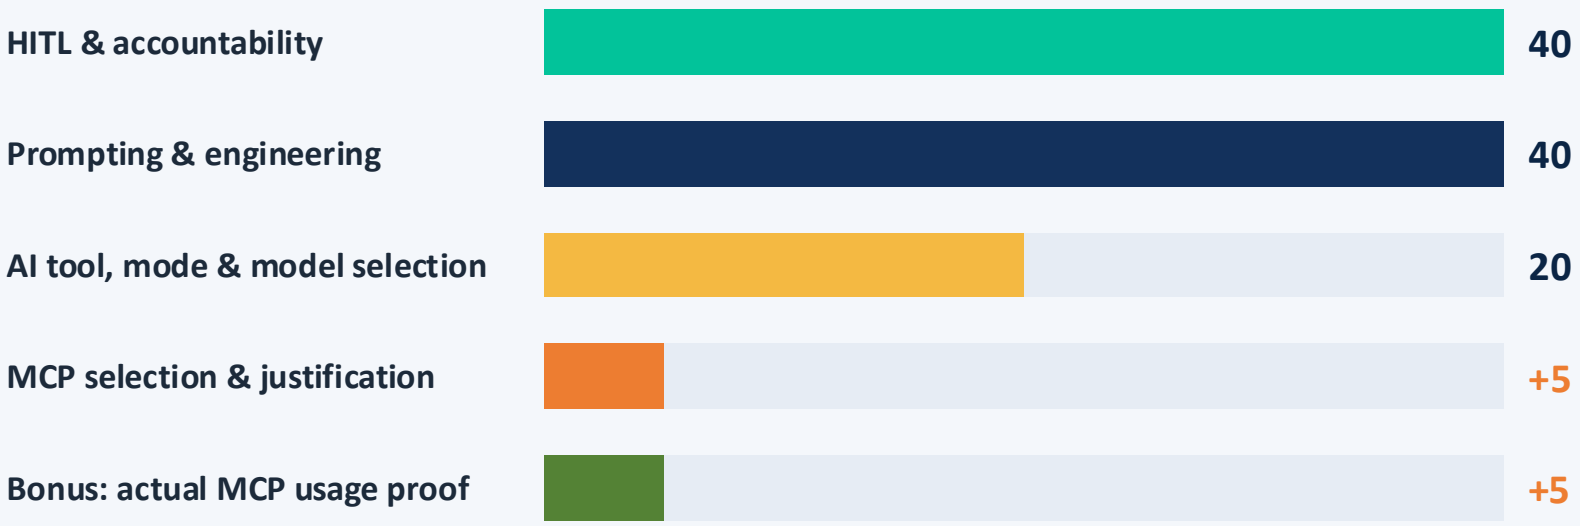

Submit

A PowerPoint report deck of your artifacts, plus your AI chat sessions.

START HERE

How you are scored & what it takes to pass

Weighting of the 4 criteria (+ bonus)

To Pass

80+/100

points overall

AND nothing scored at Level 1

A single Insufficient (Level 1) score blocks a pass — even with a high total.

Choosing the right tool for your role

ROLE	CHAT	WORK	CODEX
Developer	Clarify requirements, compare designs, explain code, estimate points	README, design notes, evidence report, ADR decision records	Implement, refactor, unit tests, debug, code review, run test suite
Tester	Test analysis, risk brainstorming, exploratory charters, acceptance criteria	Test plans, case suites, test data sets, defect & quality reports	Playwright/automation, run tests, triage failures, regression
BA	Elicitation banks, ambiguity review, stakeholder framing	Requirement specs, process/data models, user stories, traceability	Rarely — only diagram-as-code (PlantUML/Mermaid)
PM	Risk brainstorming, comms drafts, option analysis	Project plans, estimation packs, status/health & closure reports	Rarely — scripted metrics or report automation
Security Engineer	Threat modeling, vulnerability triage, secure design review	Security assessment reports, policies, remediation plans	Scan & fix vulnerabilities, patch dependencies
Non-Delivery Member	Research, summaries, meeting prep, drafting	Reports, decks, process docs, email & document workflows	Not applicable — no coding work

Credit note: BA, PM, Non-delivery tasks are mostly Chat + Work. Dev, CyberSec & Tester lean on Codex, which burns credits faster — plan accordingly.

Credit budget: consume tokens safely

Spend

tokens safely

Treat your credits as a fixed budget, not a starting balance.

GPT Luna	Your default — drafting, docs, test design, straightforward code.	**Start here for everything. Lowest cost.**
GPT Terra	Step up only when GPT Luna struggles — multi-file, tricky debugging, trade-offs.	**Use deliberately, for specific steps.**
GPT Sol+	Tasks needing GPT Sol+ tier are out of scope for Flow-2.	**Should not use.**

Habits that protect your budget: Plan before you prompt · keep threads short · don't re-run to "see if it's better" · check your balance often.

Know your modes: Chat, Work & Codex

Chat

A conversational thinking partner

BEST FOR Questions, brainstorming, comparing options, quick rewrites

Web · desktop · mobile

Work

A delegated agent that plans, executes multi-step jobs & returns a finished artifact

BEST FOR Documents, spreadsheets, decks, analyses, reports from files & tools

Web · desktop (local files)

Codex

A coding agent that reads your repo, edits files, runs commands & tests

BEST FOR Implementation, refactoring, test automation, debugging, PR-ready changes

App · IDE · CLI · Cloud

Choosing the wrong mode is the most common source of wasted credits.

SECTION 4

MCP servers that may help your project

What is MCP? MCP (Model Context Protocol) is like a universal plug for AI. It lets an AI assistant connect safely to the tools you already use (Jira, GitHub, a browser, your files) so it can look things up and do tasks for you, with no copy-pasting.

MCP SERVER	WHAT IT GIVES YOUR AGENT	
Atlassian (Rovo)	Jira, Confluence, JSM, Bitbucket	BA · PM · Tester
GitHub	Repos, issues, PRs, code search, CI status	Dev · Tester
Playwright	A real browser the agent can drive	Tester
Filesystem	Read/write an allowed local folder	All roles
Database	Queries against a test DB (PG/MySQL/Supabase)	Dev · Tester
Figma	Design files, components, variables, styles	Dev
Context7	Up-to-date library documentation	Dev

What's actually required

REQUIRED

Select the right MCP for the task and explain why it fits.

OPTIONAL

Actually integrating/operating a server. You can pass without connecting one.

BONUS +5

Proof of real use: connected server + tool call + result.

SECTION 5

Deliverables: what you submit

MANDATORY

Flow-2 report deck

The assessed artifact — .pptx, 16:9. Must stand on its own without you presenting it.

OPTIONAL — BONUS

Additional option package

.zip or git repo / PR — a second/third option to the same evidence standard.

Deck conventions

File name

Flow2_[Account]_[Program]_Option_[Number of option].pptx

Format

.pptx 16:9 — 16 required sections, ~18–25 slides for one option. No PDF-only.

Screenshots

Legible at 100% zoom, cropped, one-line caption.

Redaction

Black out client names, data & credentials first.

Every slide is tied to a Section 9 metric — skip a slide and you lose the marks attached to it.

SECTION 6

Chat-session evidence — mandatory, not optional

Why it matters

Screenshots show moments; the chat session shows the whole journey.

It's the only evidence that proves the reasoning in your deck actually happened.

Do NOT tidy the conversation — your weak prompts and corrections are exactly what earns marks.

What counts?

The actual threads (Chat, Work, Codex) that materially shaped the deliverable.

How to submit?

Download file output sample and update your own data and submit. File example*: Flow2_[Account]_Flezi-E1-BA_Option_[Number of option]*
Valid programs: *Flezi-A, Flezi-E1-Dev, Flezi-E1-Tester, Flezi-E1-BA, Flezi-E1-PM, Flezi-E2*

How to label?

[Mode] — [what it produced] — [date]. e.g. "Codex — booking API + unit tests — 12 Sep".

Before sharing?

Redact client names, data & credentials. Map each session to a slide or increment.

Bonus points & red flags that block a pass

Bonus points (max +15 total)

Proof of MCP use

Connected server + tool call + result

+5

Additional task option

Second/third option (max 2), same evidence bar

+5 ea.

Reusable workflow

Documented, repeatable for a real project

+3

Red flags that block a pass

- Unreviewed AI output — no sign of human inspection
- Fabricated or unverifiable evidence
- Confidentiality breach — unredacted client/customer data
- Unapproved agent writes to Jira / repo without preview
- Out-of-scope model use (GPT Sol+ tier or higher)
- Budget overrun without control or pacing

SECTION 8

Self-check before you submit

- [ ] Does my deliverable fully satisfy every item in my chosen option?
- [ ] Can I point to 3+ places where I corrected or rejected AI output?
- [ ] Can I explain why I chose each mode, model tier, and MCP?
- [ ] Have I shared/exported every substantive chat session, labelled?
- [ ] Is my evidence readable by someone who was not there?
- [ ] Have I reported my credit consumption? Is anything confidential redacted?

Stuck? Access & network → your project's IT/PIM route. Task & assessment questions → FSA via the usual program channel.

Remember

80+

and nothing at Level 1

Direct the AI.
Prove your judgement.
Evidence everything.
